Fulde S. Obtaining the Erucyl Chloride from Erucic Acid.

"Otrzymywanie chlorobezwodnika kwasu erukowego z kwasu erukowego" (Prace Gł. Inst. Przem. Roln. i Społ. No. 2), Warszawa, 1952
PWT, 7.3 pp.

A method of obtaining chloranhydrides, special consideration being given to the method of obtaining erucyl chloride from erucic acid. The author chose, from among: the widely known chloridizing agents, thionyl chloride and phosphorus trichloride for obtaining chloranhydrides of fatty acids from the fatty acids or their alkaline salts. Better results were obtained by using phosphorus trichloride. The actual yield of erucyl chloride was 90% of the theoretical value. Erucyl chloride obtained by this method is sufficiently pure for further operations. Since erucyl chloride is subject, under the influence of atmospheric moisture, to a distinct decomposition, it should be processed immediately after being obtained. When stored, it should be secured against the effect of moisture.

Fulda S. Superficially Active Erucic Acid Substances.

Substancje powierzchniowo czynne z kwasu erukowego, (Prace GI.

Inst. Przem. Roln. i Społ. No. 3), Warszawa, 1964, FWT, 11 pp.

Report on the results of experiment to obtain a number of new erucic acid derivatives. Condensation, by means of N-methyl taurine, of the chloranhydride of erucic acid gave an Igepon T type product; reaction between the chloranhydride of erucic acid and sarcosine gave a product of the Medialun A type. Gerdinol CA type products were obtained by treating erucic alcohol with sulphuric acid. All these substances are characterized by superficial activity in nature. Moreover, a cation-active product of the Velan PF type, possessing impregnating qualities, was obtained from erucic alcohol. The experiments resulted in the determination of the chief, physical and chemical qualities of the products obtained, and enabled their utility features to be compared with the reference-standard specimen.

TITLE: Vulcanization process for natural and synthetic rubber. Class 39, No. 190557 [announced by Scientific Research Institute of the Tire Industry (Nauchno-issledovatel'skiy institut shinnoy promyshlennosti)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 2, 1967, 85

TOPIC TAGS: vulcanization, natural rubber, synthetic rubber ~~scorching~~

ABSTRACT:

An Author Certificate has been issued for a process for vulcanizing natural and synthetic rubber in the presence of vulcanization accelerators. To improve the stability of rubber mixtures to scorching, the method provides for the use of N-(2-benzothiazolethio)phthalimide as the accelerator. [BO]

21. Evaluation by wear tests of grey iron brake blocks of railway rolling stock. *Trudy Vsesoyuznogo Nauchno-Issledovatskogo Instituta Zhелеznodorozhnogo Transporta* (Scientific Review of Communication - *Trudy Vsesoyuznogo Nauchno-Issledovatskogo Instituta Zhелеznodorozhnogo Transporta* - Vol. 3, 1953, No. 11-12, pp. 439-448, 11 figs, 5 tabs.)

Since grey iron brake blocks are consumed in large quantities the determination of the wearing properties primarily wear depending on hardness, is extremely important from the standpoint of economy. Due to the nature of the properties of wear the laws governing the wear of grey iron which have been determined under different conditions cannot be numerically applied to brake blocks. Service tests with brake blocks applied to locomotive wheels have been conducted for the purpose of plotting hardness-wear curves. Differences in the wearing time of blocks used on various locomotives can be eliminated by introducing the notions *relative wear* and *relative life* (the unit of relative wear is the wear of a 240 Bhn block, relative life is the reciprocal of the former). Thus the wear data of all blocks could be presented in a single graph from which the hardness-wear curve could be plotted. The formula given below for computing the probable relative life of a great number of brake blocks was deduced by the statistical treatment of the hardness-wear curve and

$B_{50} = 110$

the hardness data of 1000 brake blocks. $L_p =$

where L_p is the relative life; B_{50} is the hardness of the specimen; B_{min} is the minimum hardness (approx. 160 Bhn) at which blocks may be economically used is determined by computation.

76. Wear resistance tests on modified cast iron conducted in laboratory and in railway service — P. Varga, E. Füle. (*Kohászati Lapok, Outside* — Vol. 6, 1955, No. 4, pp. 85-91, 10 figs., 2 tabs.)

MG

Laboratory and service tests have been conducted on brake shoes made of modified cast iron. Both have proved that shoes of cast iron modified with CaSi are far more resistant to wear than those of plain cast iron having the identical degree of hardness. Shoes of cast iron modified with FeSi however did not show a marked improvement. This can be explained by the fact that the arrangement of the graphite and the structure of cast iron modified with CaSi are more satisfactory than those of cast iron modified with FeSi.

TITLE: Encephalitis ^{644.35} topical problem

SOURCE: Microbiologia, parazitologia, epidemiologia, v. 10, no. 1, 1965, 69-75

TOPIC TAGS: nervous system disease, epidemiology, encephalitis, virology, clinical medicine

ABSTRACT: The authors report on 242 cases of primitive infections of the central nervous system of probably viral origin, occurring in Ploiesti region. The clinical and epidemiological analysis shows that the number of cases of encephalitis is on the increase since 1950; that the cases are dispersed throughout the region without epidemic foci, with 60 percent of the cases and 40 percent of the mortality among children under 10 years and especially under one year; and that the frequency is greater during the winter. The authors suggest that encephalitis be declared a reportable disease to facilitate the collection of statistics and the proper epidemiological study of the disease. TITLE: Clinical and epidemiological considerations on 418 cases of tetanus

SOURCE: Microbiologia, parazitologia si epidemiologia, v. 11, no. 2, 1966, 155-162

TOPIC TAGS: epidemiology, serum, penicillin, bacterial disease, clostridium, clinical medicine

ABSTRACT: An analysis of 418 cases of tetanus observed by the author in the years 1934 to 1962. Of the cases, 102 involved umbilical tetanus, with a 77 percent mortality rate, and 316 in adults or children with a mortality rate of 36.6 percent. Other results of the statistical analysis: the incubation period is usually between 7 and 14 days, with 3 days the shortest noted; the most critical period with the highest mortality is the first week after infection; location of the infection has no noticeable effect on the outcome; serum therapy plus penicillin reduces mortality to 20.1 percent. Orig. art. has: 6 tables. [Based on author's Eng. abst.]

Title : Controlled Fattening and Meat Productivity of Swine.

Orig Pub: Nas chov, 1957, No. 23, 635-637

Abstract: The necessity of selecting 3 piglets thoroughly from a litter for testing purposes is discussed in this article. These piglets are to be sent to a testing station for the study of fattening properties and meat productivity of purebred swine progeny. Also discussed is the necessity of experimental fattenings and evaluation of obtained results by a single method which the Academy of Agricultural Sciences should develop.

Polinski, A.

Thermomelting in multicomponent liquid systems
D. Baranowski and A. Polinski, Polish Acad. Sci. Warsaw,
Publ. 1981, 1982, at 4-19, 1981, 1982, 1983, 1984, 1985,
on the basis of the theory of the thermomelting of
crystals.
Formula is developed for the thermomelting of components in
any mixt., e.g., of two, three, four, or more components, and
hitherto considered particular cases (cf. de Groot, C.A. 48,

3833a; Alexander, C.A. 49, 37f; Hase, C.A. 48, 3111;
Karger, C.A. 50, 633a). Both de Groot's and Hase's
treatments appear to be limited to the solid because it
was necessary to introduce this assumption in order to
obtain their equations. The equation is discussed for a
particular case of ternary systems and ionic ions. It
predicts whether addn. of a 3rd liquid will improve or not
improve the thermomelting of the system.

Title : Heat Transfer of Hydrochloric Acid, Sodium Chloride and Potassium Chloride in Aqua Solutions.

Orig Pub: Roczn. chem., 1957, 31, No 1, 229 - 240.

Abstract: The Soret coefficient (SC) in aqua solutions of HCl, KCl and NaCl in a concentration range of 1 - 0.05 n., correct to ≤ 10 percent, was determined by the electric thermo-diffusion method. The SC versus initial solution concentrations are presented on graphs. The SC values are practically constant at concentrations of 1 - 0.3 n.,

Abs Jour: Ref Zhur-Khimiya, No 17, 1958, 56845.

Abstract: they increase rapidly in the 0.3-0.05 n. range. The heat transfer versus concentration is similar. The obtained SC values coincide with the results obtained by Alexander (RZhkh, 1956, 57608; 1957, 302) (for 0.05 n of KCl and NaCl solutions) and are analogous to the results obtained by Tanner (RZhKh, 1954, 42769) and Temkin-Khoroshin (Zhurnal Fizicheskoy Khimiya, 1952, 26, 773). A thermo diffusion separation was carried out in 3 - component solutions (HCl - NaCl - H₂O and HCl - KCl - H₂O), whereby the presence of an electrolytic inversion was determined.

the mass flow perpendicular to the plates has been determined. A calculation of the change in the concentration of the substance under test in the storage cylinders ['zapasnyy sosud'] is given. It is shown that the ratio of the concentrations of the test substance in the upper and lower storage cylinders differs by the constants α and $\sqrt{}$ from that given by the formula of de Groot which has been applied to the case of thermogravitational separation. A new ECP separation method is proposed. The working volume of the substance to be investigated is enclosed between two parallel plates made from small thicknesses of insulating material. Electrodes are placed above and below the working volume and an a-c current is applied to the electrodes in such a manner that
